FACTORES DE MUESTREO PARA HONDURAS

Los Factores de Muestreo nos ayudan a caracterizar a los grupos de poblacion de los lugares donde se deben llevaron acabo los estudios ponderados de Bienestar Siguiendo las conclusiones extraidas de estudios de bien estar realizados en zonas rurales en Africa y Latinoamerica se utilizaron los siguientes factores de muestreo para Honduras

1 Altitud orografica

2 Densidad de la Poblacion (Habitantes/ Km2)

3 Indicador de Etnicidad

4 Indice de Servicios Basicos(Combinacion de indicadores de salud y educacion)

5 Indice de Accesibilidad(Accesibilidad a centros con mas de 2000 habitantes)

6 Predominancia generica

Estos factores son teoricamente los mas apropiados para obtener una caracterizacion de la poblacion segun factores ambientales y humanos Por el contrario no se pudieron usar todos ellos debido a la inexistencia de informacion apropiada

El Proyecto de bienestar para Honduras segun la investigacion participativa se inicio con la idea que se realizaria a escala nacional Debido a condiciones externas tuvo que reducirse a un estudio de 4 departamentos Atlantida Yoro El Paraíso y La Paz El estudio de caracterizacion por el contrario se realizo para toda Honduras como un ejercicio teorico y para los 4 departamentos como el analisis a seguir Para ambos estudio se utilizaron los indices e indicadores tal y como se muestra a continuacion

1 ALTITUD OROGRAFICA

Este estudio esta enfocado esencialmente para la zona de laderas con lo que se consideraron de interes solo aquellas aldeas localizadas por encima de 500 metros de altura. Así los grupos considerados fueron los siguientes

| ALTURA | Codificación |
|--------------------|--------------|
| <500 metros | <500 |
| > 500 m y < 1000 m | 500 1000 |
| > 1000 m | >1000 |

De las 3570 aldeas georeferenciadas para Honduras 1326 aldeas se encuentran entre 500 y 1000 metros de altura y 863 aldeas están por encima de los 1000 metros. En resumen 2189 son las aldeas por encima de los 500 metros para todo Honduras.

En los cuatro departamentos seleccionados encontramos 358 aldeas por encima de los 500 metros.

El **mapa 1** muestra las aldeas por encima de los 500 metros sobre un modelo de elevación digital donde las zonas de mayor pendiente aparecen en color marrón oscuro y las zonas planas en marrones claros.

2 DENSIDAD DE POBLACION

La información de densidad de población tiene las siguientes características estadísticas

| ESTATISTICAS | Habit/km2 |
|-------------------|-----------|
| CANTIDAD | 3570 |
| MEDIA | 75 57 |
| MAXIMO | 12257 78 |
| MINIMO | 0 1175 |
| RANGO | 12257 66 |
| DESVIACION TIPICA | 352 88 |

La informacion se puede estructurar en tres grupos densidad de poblacion baja media y alta tal y como se observa a continuacion

| CLASIFICACION | Habit/km2 | |
|---------------|-----------|----------|
| BAJA | 0 117 | 21 396 |
| MEDIA | 21 396 | 54 318 |
| ALTA | 54 318 | 12257 78 |

El calculo de la densidad de poblacion se realizo dividiendo el espacio nacional segun los poligonos de Thyessen De esta forma se asigno geometricamente a cada aldea el espacio que le corresponderia Esta metodologia no es la mas correcta ya que asigna espacio geograficamente sin consider el peso de poblacion existente en cada punto Por el contrario con el fin de calcular la densidad de poblacion es el medio mas aceptado y por supuesto que mas adecuado que usar la division administrativa municipal como espacio a asignar

El **mapa 2** siguiente muestra todas las aldeas por encima de los 500 metros clasificadas segun densidad de la poblacion

3 INDICADOR DE ETNICIDAD

Se queria representar de alguna forma la etnicidad de la poblacion por el contrario toda la informacion que encontramos sobre la distribucion etnica es muy vaga El censo de poblacion y vivienda muestra hablantes de lenguas autoctonas por el contrario la informacion que refleja es incompleta Se decidió utilizar un mapa aproximado de distribucion etnica encontrado en un Atlas Geografico de Honduras por no contar con otra informacion

El **mapa 3** muestra la distribucion de la poblacion etnica en Honduras

Siendo este un indicador un tanto impreciso se quiso hacer la prueba de cuales serian los resultados incluyendo el indicador etnico y sin incluir este factor Los resultados son combinaciones distintas de informacion tal y como se observa en los anexos 1 y 2

4 INDICE DE SERVICIOS BASICOS

Este es un Indice Combinado de indicadores de educacion y sanidad. Los indicadores seleccionados fueron ponderados segun la importancia que pudieran tener en este pais (siguiendo el estudio de pobreza del FHIS)

Los indicadores elegidos son los siguientes

4.1 Indice de Educacion

- Porcentaje de poblacion que no puede leer o escribir (analfabetismo)
- Porcentaje de poblacion que tiene 5 o menos de 5 años de escolaridad (Primaria)

Se eligio una ponderacion de 75 para el indicador de analfabetismo y de 25 para el de Primaria ya que segun el estudio de Ramon Lopez¹ en Honduras la relacion entre ingresos y educacion es concava alcanzando el maximo efecto marginal en 3 a 4 años de educacion y mostrando un efecto de declive marginal despues de los 4 años de educacion

$$\text{INDICE DE EDUCACION} = (\text{Analfabetismo} * 75) + (\text{Primaria} * 25)$$

4.2 Indice de Servicios Sanitario

- Indicador de suministro de agua Porcentaje de casas con las siguientes condiciones
 - No Tuberias de Agua
 - Tuberias de agua a mas de 100 metros de la vivienda

- Indicador de Servicio Sanitario Porcentaje de viviendas con las siguientes condiciones
 - Letrina Hidráulica (ponderación de 20)
 - Letrina Simple (ponderación de 30)
 - No servicio (ponderación de 50)

Los indicadores sanitarios fueron combinados tal y como se expresa a continuación

$$\text{INDICE DE SERVICIO} = (\text{Suministro de Agua} * 50) + (\text{Servicio Sanitario} * 50)$$

El Índice final de SERVICIOS BASICOS combina ambos tanto el índice de servicios como el índice de educación ponderando ambos igual (50 50)

El índice lo estandarizamos de la siguiente manera

$$\text{INDICE DE SERVICIOS BASICOS ESTANDARIZADOS} = (\text{Ibs} - \text{Ibs min}) / (\text{Ibs max} - \text{Ibs min}) * 100$$

Ibs = Índice de servicio básico para cada aldea

La estandarización permite una mejor comparación interna de los datos

Las estadísticas básicas de los datos obtenidos del índice básico estandarizado son las siguientes

| ESTADISTICAS | Índice de Servicios Basicos |
|---------------------|------------------------------------|
| SUMA | 158524 73 |
| CANTIDAD | 3570 |
| MEDIA | 44 4 |
| MAXIMA | 100 |
| MINIMO | 0 |
| VARIANZA | 295 96 |
| DESVIACION TIPICA | 172 |

La información resultante puede agregarse según aparece a continuación

| CLASIFICACION | Indice de Servicios Basicos |
|---------------|-----------------------------|
| Aceptable | 0 - 35 |
| Regular | 35 - 55 |
| Mala | > 55 |

El **mapa 4** muestra la distribución de las condiciones sanitarias de las aldeas de Honduras en el ámbito nacional

5 INDICE DE ACCESIBILIDAD

La accesibilidad se calculó según las horas de distancia desde cada aldea hasta los principales centros de actividad económica. Como centros de actividad económica principales se seleccionaron aquellos con más de 2000 habitantes. Se utilizaron diferentes impedimentos para atravesar carreteras y caminos y campo a través. Los niveles de accesibilidad obtenidos cuentan con la limitación de un mapa de carreteras muy desactualizado a la vez que sin una clasificación útil de las condiciones de las mismas.

Los grupos calculados son los siguientes

| ACCESIBILIDAD |
|------------------------------|
| Menos de 1 hora de distancia |
| Entre 1 y 2 horas |

| |
|-------------------|
| Entre 2 y 6 horas |
| Mas de 6 horas |

Estos grupos se reclasificaron tal y como prosigue

| ACCESIBILIDAD | Tiempo de Viaje |
|---------------------|---|
| Buena Accesibilidad | Menos de dos horas de distancia de un centro de actividad |
| Accesibilidad Media | Entre 2 y 6 horas de un centro de actividad |
| Accesibility Baja | Mas de 6 horas de un centro de actividad |

Se puede observar los distintos niveles de accesibilidad en el mapa siguiente(mapa 5)

6 INDICE DE PREDOMINANCIA GENERICA

Este índice muestra la predominancia generica de la aldea

Se contabilizo el numero de hombres y el numero de mujeres en cada aldea. El índice puede tener tres valores como se muestra a continuacion dependiendo si predomina el sexo femenino el masculino o la existencia de entre un 48% y un 52% mas de hombres que hombre que de mujeres

| GENERO PREDOMINANTE | Codificación |
|----------------------------|--------------|
| Entre 48% y 52% de hombres | 1 |
| Mas hombre que un 52% | 2 |
| Mas mujeres que un 52% | 3 |

RESULTADOS DE LA COMBINACION DE LOS FACTORES

Se clasifico cada aldea segun los factores antes mencionados y se agruparon aquellas aldeas que tenian combinacion de factores similares

Por ejemplo la aldea El Chile en el Municipio de Puerto Cortes esta caracterizada por
Altura menos de 500 metros
Densidad de poblacion alta
Etnicidad noetnias
Servicios Basicos Aceptable
Accesibilidad buena
Genero predominante entre 48% y 52% masculino

Existian en toda Honduras 91 aldeas con caracteristicas similares a El Chile

Como antes se menciono se quiso obtener varios resultados combinando distintos factores con el fin de ver distintas realidades Los resultados que se obtuvieron son

1 Para todo Honduras nivel nacional

- 1 1 Para todo Honduras considerando todas las alturas (no solo por encima de los 500 metros) y utilizando el indicador etnico se obtuvieron 394 combinaciones de grupos de poblacion con distintas caracteristicas Ver **anexo 1**
- 1 2 Combinaciones para toda Honduras sin considerar el indicador etnico fueron 181 grupos distintos Ver **anexo 2**
- 1 3 Para todo Honduras en areas por encima de los 500 metros considerando el indicador etnico obtuvimos 268 combinaciones **Anexo 3**
- 1 4 Todo Honduras por encima de los 500 metros y sin indicador etnico salieron 115 combinaciones.**Anexo 4**

2 Para los cuatro departamentos seleccionados ATLANTIDA EL PARAISO LA PAZ y YORO Son 749 el numero de aldeas con las que contamos para estos cuatro departamentos

- 2 1 Combinaciones para las aldeas en todas las alturas Las combinaciones son 144.**Anexo 5**
- 2 2 Combinaciones para las aldeas por encima de los 500 metros Obtuvimos 93 grupos distintos Este es el conjunto de aldeas y combinaciones que se utilizaran para el analysis posterior.**Anexo 6**

Para poder visualizar la información de las combinaciones existentes en los 4 departamentos se hizo necesario introducir un campo llamado cod_num este es simplemente un numero que identifica cada combinación para facilitar su pintado En el listado de las aldeas con su caracterización nombre de aldea y municipio también aparece dicha codificación

Así los mapas que contienen las combinaciones de factores tienen unas leyendas con números y estos tienen su significado en los listados con el título de leyenda de códigos

ANEXO 1 COMBINACIONES DE POBLACION PARA TODO HONDURAS A TODAS LAS ALTURAS Y CONSIDERANDO LAS ETNIAS

394 Combinaciones

| Densidad de Poblacion | Servicios Basicos | Acceso | Etnias | Altura | Genero | Frecuencia | Poblacion |
|-----------------------|-------------------|--------|-----------|--------|--------|------------|-----------|
| media | Acceptable | media | noetnias | <500 | 2 | 8 | 2689 |
