FOREWORD AND ACKNOWLEDGMENTS

This report represents part of my activities during my stay with the Cassava Biotechnology Network (CBN) at CIAT in Colombia. During 2.5 years working on the project of priority setting for cassava research and development. I learned many things. I worked in an international environment in a multidisciplinary research program which helped me to look beyond trodden paths. The experience of living in Colombia is unforgettable, I thank my friends for the time we shared together.

Professionally I owe thanks to a number of persons First and most of all, Dr Guy Henry ex-Cassava Economist at CIAT, now with PROAMYL-CIRAD in France who supervised the work I did for the Cassava Biotechnology Network. He did not lose his motivation to bring this project to a good end. Also many thanks to Dr Ann Marie Thro. Coordinator of CBN. She contributed in a more personal way to the project. With reference to the current study also thanks go to the following persons. Dr Rupert Best, Project Leader of Rural Agro-Enterprises at CIAT for reviewing the first draft of this report, Dr Reinhardt Howeler, CIAT's Regional Representative for Asia, for his belief that this project was worth being done, and the individuals from eight countries who contributed by completing sometimes complicated questionnaires.

My professional future is with FAO in Kenya in a project on coordination of emergency assistance in the Great Lakes Region Contact through FAO-KEN@field fao org or fax + 254 2 727 584

1 INTRODUCTION

This report is the result of an assessment of needs in cassava root production, and cassava processing and marketing activities in Latin America and Asia. The study is based on information from a variety of resource persons working with cassava in eight countries. Brazil, Paraguay, Colombia, Thailand, Indonesia India, China, and Vietnam. The current assessment originates from two events that occurred around the same time. In 1996, the Cassava Biotechnology Network was looking for new ways to continue the assessment of constraints and opportunities in cassava, while the Global Cassava Development Strategy launched the plan for needs assessment in the three cassava growing continents. More information about these and other initiatives is given in Chapter 2 on background and history of the study. In Chapter 3 the objectives of the study are formulated. The methodology that is followed is dealt with in the three paragraphs of Chapter 4. Chapter 5 discusses agro-ecological classification for cassava cultivation. Results of the investigation are presented in Chapter 6, while conclusions and recommendations are given in the last Chapter 7.

This report does not have the pretention of serving the reader with a quick list of ranked priorities. It does not present a comprehensive overview of constraints and opportunities per continent by agro-ecological zone. But it does give clear indications on needs in the different cassava sectors in the earlier mentioned eight countries, based on information from local respondents. It adds to previous studies by providing a detailed and quantified assessment of constraints in post-harvest subsectors. In earlier studies, cassava processing and marketing was not very well represented. The present document can be used as a reference about limiting factors in principal cassava producing regions and countries in Latin America and Asia. It may serve individual researchers and people working in cassava development to get more feeling for the context of the problems they are working on

2 BACKGROUND AND HISTORY

2 1 USER-BASED NEEDS ASSESSMENT AND THE CASSAVA BIOTECHNOLOGY NETWORK

The Cassava Biotechnology Network (CBN) is a special project headquartered at the International Center for Tropical Agriculture (CIAT), based in Cali, Colombia, and funded by the Dutch government during its first phase from 1992 - 1997 Major objectives of CBN are enhancing interaction and communication between biotechnology cassava researchers around the world, as well ensuring that farmers' and processors needs and demands with respect to cassava are represented in research agendas. To accomplish the second objective a cassava literature review was done and a rapid rural appraisal of cassava constraints and opportunities in Northern Tanzania. Also a research proposal was developed that targets the development and application of a socioeconomic, technical, and agroecological framework for cassava research priority setting, with special reference to biotechnology. The present report is a result of one of the activities that was undertaken based on this research proposal.

To CBN and its donor it was important to have present in the study the opinion of the people that economically rely on the cultivation and processing of cassava During the study various approaches were tried in order to involve users in the assessment of needs. At a continental and global scale there is no example known of commodity priority setting that clearly involves end-users from the first up to the last step of such a study. It is a fact that especially in the past, research agendas were set by researchers policy makers and donors. Nowadays, a strong tendency is observed towards the involvement of target groups in multiple ways transforming research into participatory research.

2.2 CIAT'S CASSAVA PROGRAM

In 1993, the CIAT Cassava Program was faced by demands from both national and international cassava research and development (R & D) institutions, to quantify cassava sector constraints and opportunities. The result was a global study (Henry 1995) and included two major elements. The first element was an assessment of constraints and opportunities that existed in the cassava sector worldwide. The methodology consisted of a Delphi survey in which two levels of the sector were targeted production and processing/marketing. Questionnaires were developed and sent for completion to selected national agricultural programs and to IITA, CIAT's sister centre which also undertakes cassava research. Production regions were classified into five agro-ecological zones.

The second element in the study was an ex-ante benefit estimation of cassava research and development activities. For this estimation, three criteria were used

efficiency, equity, and sustainability R & D activities were subdivided in gene pool development, crop management, and post-harvest utilization. Furthermore, the agro-ecological classification was complemented by two classes for cassava product demand strength, i.e. traditional and diversified markets.

2 3 GLOBAL CASSAVA STRATEGY

The International Fund for Agricultural Development (IFAD) launched in 1996 the initiative for the creation of a Global Cassava Strategy, supported by institutes in the world that play a major role in cassava research and development. The Strategy will be developed based on regional reviews and country case studies. The regional reviews will identify constraints and opportunities in the different cassava subsectors for further development of the cassava crop and its products.

CIAT was appointed as institute responsible for the regional review of Latin America and Asia. In May 1996 a proposal was presented to IFAD for execution of these reviews. Approval was received early October that same year. The current document reports on the work that was done as a contribution to the regional review for the cassava commodity in Latin America and Asia.

3 OBJECTIVES

The general objective of the present study is to present an assessment of quantified constraints and opportunities in cassava. The study focuses on major cassava growing regions in the continents of Latin America and Asia. We are limited to these two continents because of the mandate that CIAT has for cassava, and the division that IFAD made in the execution of their regional reviews. IITA is the executive institute for Africa's regional review, while CIAT is for Latin America and Asia.

The study covers the entire commodity system of cassava, i.e. the cultivation of the cassava crop in the different agro-ecological zones that exist for cassava, the processing of roots into final or intermediate products, and the sale of these products into the different markets that exist for cassava derivatives. By dealing with constraints and opportunities in the entire cassava commodity system, successive areas and fields in research and development are targeted.

- germplasm development (root yield and root quality),
- crop management,
- processing technologies,
- marketing

The specific objective of the study is to make available to researchers, policy makers, and donors an assessment of quantified needs in cassava production processing, and marketing that is very much based on opinions of the people that directly earn part of their income from cultivating, processing, and/or marketing of cassava. To achieve this goal the involvement is needed of as many clients of technology and advances in cassava as possible, or the involvement of people that are in direct contact with them like extensionists and development project workers. Clients are the earlier mentioned, end-users of technology, i.e. farmers, processors, and marketeers. This group of people are the principal actors in the cassava commodity system and target group for many research and development activities.

4 METHODOLOGY

4.1 SURVEY INSTRUMENTS

Three survey instruments were developed that capture the cassava commodity system. Each instrument is a questionnaire that covers successively cassava production fresh cassava, and processed cassava products. In the questionnaire respondents are asked for their opinion about the extent (affected area/product volume) of each constraint, the increase in yield or product price, and reduction in processing costs, that will be obtained once the constraint has been removed. Also area, price, and yield information were requested. Respondents were asked for an estimate for potential yield product price, and processing costs, in order to check the reliability of the data given later in the questionnaire. A copy of the survey instruments, preceded by explanatory notes, is annexed (Annex 1)

The basic design for the questionnaires was taken from the prioritization exercise that was done by CIAT's Cassava Program (see paragraph 2.2). The units of measurement in the three different questionnaires were chosen in such a way that all sets of constraints could be expressed by a common denominator. The US dollar was chosen as common denominator, satisfying the need for a unit that is comparable across different types of constraints, as well a unit that is quantifiable.

In the production questionnaire a subdivision is made by agro-ecological zone. This is necessary because constraints in cassava cultivation are to a large extent determined by climate and soil conditions. Chapter 5 deals entirely with agroecological classification of cassava production. The two questionnaires that capture post-harvest subsectors are subdivided by product groups. The underlying concept is that similar products face more or less similar root quality technology, and marketing constraints and opportunities.

The reason to develop three different questionnaires was to link up with mainstream types of research Many research programs distinguish between the pre- and post-harvest phase of the commodity. Thus a pre-harvest, is production, questionnaire was developed, while the post-harvest one was subdivided into two separate questionnaires. One for fresh cassava and another targeting processed cassava products, while both contain a section on marketing of the product. The subdivision originated in the fact that fresh cassava for human or animal consumption does not receive any treatment and is marketed or used directly from the field where it was harvested, and within approximately 48 hours due to perishability. Whereas, for processed products, technology is used for conversion of roots into different types of product.

Each instrument contains a set of constraint sections. It is logical to group together constraints that are of the same nature. For example, bacterial blight,

stem rot, etc in 'pathogen & virus pressure', and drought susceptibility, poor germination, etc in 'genetic characteristics of cassava'. This also facilitates analysis later on. Another reason for grouping of constraints is that respondents are prevented hopefully from double-counting. This is a serious problem. In not few cases constraints are interrelated and could easily be counted twice. It may never be possible to rule this out, and it helps us relativize the results of the needs assessment. A scientist in particular likes to disaggregate as far as possible, but growing conditions do not always permit us to do so. An example of interrelationship of two constraints is the following. A cassava crop that does not receive sufficient nutrients to develop ('soils and crop management constraint) is more vulnerable to an attack of mealy bug ('pests' constraint) than a well-developed crop in which the first mentioned constraint is not a limiting factor.

Survey instruments were preceded by extended explanatory notes. These notes functioned as a guide to the respondent while completing the questionnaire Because of the complexity of the questionnaires such notes were expected to be necessary in order to obtain reliable data.

4.2 DATA COLLECTION

Data collection had to be done in the continents of Latin America and Asia. As mentioned in the chapter on Objectives, it was important in this study to involve end-users to the widest extent possible. Since it was financially and technically not feasible to visit all principal cassava growing countries in the two continents and talk with farmers directly, a solution was sought in the regional seminars that were organized in Brazil and China in 1996.

The 1 Congresso Latino Americano de Raizes Tropicais in São Pedro -SP-Brazil, was a symposium on which participants from a variety of cassava growing countries in Latin America presented their work. Representatives from research institutes, universities, governmental institutions, and commercial, wide-scale cassava processing factories were gathered in one place. This facilitated a cost-effective data collection scheme for Latin America. We visited the symposium and during three days collaborators were selected and interviewed. Selection of respondents was based on

- 1 Representing a main cassava growing or processing area,
- 2 To get a mixture of different respondents working at a local level (researchers policy makers, commercial processors)

In November 1996 the Fifth Asian Regional Cassava Workshop was held in Hainan China It was the meeting place for Asian researchers and research policy makers. In this workshop, the present study was presented to the audience in a half-hour session. Key people were asked to take home a copy of the questionnaires. They were invited to complete the questionnaires with help and input from members of their program. CIAT's Representative for Asia was in

charge of first collection of completed questionnaires. He is the person with excellent knowledge of the region, and supervised the return of completed questionnaires from the different regions and countries in Asia.

4.3 CONSENSUS IN DATA

Data that are collected through the questionnaires will show a divergence in severity and extent of constraints. In order to make available one, overall assessment of constraints per continent, it is necessary to reach consensus with respect to the collected data. To this objective a meeting with cassava experts was planned. The ideal situation is that in an iterative process of discussion of results, finally one picture emerges for the needs assessment of the entire continent. The experts have to have an integrated view regarding cassava on a continent-wide scale. For Latin America, this group of experts was found in the members of the ex-Cassava Program at CIAT. They met in a workshop where all collected constraints information of cassava cultivation in Latin America was presented. During execution of the workshop it appeared that the meeting had more the character of a consistency check of completed questionnaires rather than reaching a consensus in data.

For Asia, a consensus meeting was more difficult to organize Although CIAT holds a mandate for cassava in Asia, in-depth knowledge of the cassava subsectors is not so much with the ex-Cassava Program but with CIAT's Representation Office for Asia, based in Thailand All collected constraints information was sent to the two CIAT-scientists in Thailand for review in order to reach consensus in data for the continent of Asia

The outcome of the data consensus meetings would provide us with the final form of the needs assessment that we are looking for For cassava cultivation an assessment of constraints per agro-ecological zone by continent, and for cassava processing and marketing an assessment of constraints and opportunities per product group by continent. Unfortunately we are not able to present these entire assessments in the present study. Nevertheless the data overviews that are presented give a good indication of needs in cassava sectors.

5 AGRO-ECOLOGICAL CLASSIFICATION

5.1 CLIMATE ZONES

As mentioned in paragraph 4.1 in the production questionnaire a subdivision was made by agro-ecological zone. This was necessary because constraints in cassava cultivation are to a large extent determined by climate and soil conditions. For use in the prioritization exercise done by CIAT's Cassava Program in 1993, an agro-ecological classification was developed based on climate conditions only. In the classification, the climatic differences in growing conditions for cassava were taken into account. Four parameters were used to distinguish between five climate zones across the three cassava growing continents. In Table 1 the zones are defined.

Table 1 Climate zones for cassava production

·	Raınfall,	Altıtude,	Dry	Latitude,
	mm	m	period,	ın °
			months	
Lowland Humid Tropics	≥ 1000	≤ 1000	≤ 3	
Lowland Subhumid Tropics	700–1000	≤ 1000	3 – 5	
Lowland Semi-arid Tropics	≤ 700	≤ 1000	≥ 5	
Highland Tropics		> 1000		
Sub-Tropics	***************************************			> 20

Source Henry & Gottret, 1996

It was decided to make use of this classification in the analysis of the results. This classification earlier has proven to be valuable and was defined in close collaboration with cassava and geographical scientists. Nevertheless a proposal for the construction of a global classification that includes soil conditions, was presented as part of the present study (see next paragraph).

From the study by CIAT's Cassava Program data on cassava area by continent and climate zone were also obtained for use in the present study. Original data come from various sources. The area data are presented in Table 2.

Table 2 Cassava area by continent and climate zone (1993)

	Latın Ameri	ca	Asıa	
	Hectares	% of total	Hectares	% of total
	(x 1,000)	area	(x 1 000)	area
Lowland Humid Tropics	417	15	690	18
Lowland Subhumid Tropics	918	33	1604	41
Lowland Semi-arid Tropics	222	8	1029	26
Highland Tropics	417	15	0	0
Sub-Tropics	807	29	598	15
Total	2 781	100	3 921	100

5.2 GLOBAL EDAPHO-CLIMATIC CLASSIFICATION

The classification of cassava production regions discussed in paragraph 5.1 has been used by CIAT to date. CIAT's sister institute IITA in Nigeria uses a different classification for cassava production in Africa. The two classifications are not compatible. That is why in the Global Cassava Development Strategy a common global classification was proposed in order to serve as a common base in the regional reviews.

As part of the present study a proposal was developed to come to such a common classification. The classification will facilitate coordination of research efforts and improve the identification of research solutions for specific ecoregions. For a full documentation see the proposal (Annex 2). The proposal was presented by Dr Clair Hershey, consultant of CIAT, to participants in the Global Cassava Strategy during a meeting in May 1997.

The proposal targets the goal of obtaining a broadly acceptable classification that all research entities could coordinate their work around. The access to research findings for clients (i.e. local institutes) and donors would be greatly improved.

The mapping of the proposed classification for Africa and Latin America was done in July 1996 by Dr Peter Jones (CIAT). Black-and-white copies of the maps are included in this report in Annex 3.

6 RESULTS

6.1 LATIN AMERICA

6.1.1 CASSAVA ROOT PRODUCTION

The data that were collected for Latin American cassava root production are included in this report as Annex 4. It is preceded by a comparative overview of the collected data with 1993 constraints data by climate zone. A consensus workshop was organized in May 1997 among a good number of ex-members of the Cassava Program of CIAT. In that meeting the data for Latin American cassava production were discussed, as well compared to the data that were collected in the exercise of CIAT's Cassava Program in 1993.

A total of eleven questionnaires were completed and returned Questionnaire number (Qtn.) LC1, LC5, and LC6 represent the subtropical climate zone Collected constraint data show similarity to the data of the 1993 exercise. The three questionnaires together cover to a wide extent the subtropics in Latin America.

Qtn LC9 is the only completed questionnaire obtained for the highlands. For the Colombian Cauca region the data are representative, but they do not give a good picture of the overall highlands climate zone in Latin America.

For the humid lowlands we received data in questionnaire LC10 Like for the highlands the data represent well the situation in the Colombian Llanos, but are not representative for the humid lowlands in Latin America

Qtn LC2 LC8, and LC11 come from North Colombia The prevailing climate zone is subhumid lowlands. The data of LC8 was considered to be 'not correct'. They differed very much from the other two questionnaires. LC2 and LC11 were accepted as representative for the climate zone. Unfortunately data from other regions in Latin America for subhumid lowlands are not available.

The semi-arid lowlands are not represented by a single questionnaire per se Qtn LC3 and LC4 both cover partly the semi-arid region in North-East Brazil At the same time these questionnaires include subhumid lowlands as well. In LC3 humid lowlands are also included so three climate zones are represented by that particular questionnaire. It implies that only one figure is given for each constraint, irrespective of the climate zone, and thus the data are difficult to analyze. Qtn LC7 covers all production regions in Brazil and was left aside in the consensus workshop for the earlier mentioned reason.

In general the collected data for a particular climate zone showed agreement in the order of importance given to the principal constraints within constraint groups,

e g the constraint of bacterial blight in all returned questionnaires for the subtropics was a main contributor to the total of constraints (% yield gain) in the group of Pathogens & Viruses

It was evident that some of the completed questionnaires were biased Respondents with certain disciplinary backgrounds stressed the constraints and opportunities in their field of work. In other cases, there are indications of inconsistancies in the collected data. The reason is that not all respondents read well the explanatory notes, i.e. instructions, that preceded the questionnaire. The result is double counting of constraints. This also raises the question of whether or not there is common interpretation of the questions.

Large discrepancies between estimated potential yield and calculated potential yield are observed. In one questionnaire the discrepancy is more than six times. This could point at constraint estimates that are not very serious. The way in which these two parameters relate is an indicator for the reliability of the data that are provided by the respondent. One may expect that the discrepancy is no more than one-and-a-half times. In order to be able to make a judgement across questionnaires about the tendency of constraints (do similar constraints receive high-or-medium-or-low weight in the different questionnaires?) a solution may be to standardize constraint figures. The problem with this procedure is that we loose part of the quantified nature of the data one of our objectives in the study.

6.1.2 POST-HARVEST SUBSECTORS

A total of four subsectors were distinguished in the cassava post-harvest sector. These are the production of starch flour and processed animal feed, and the use of fresh roots for human/animal consumption. The data that were collected are included in this report as Annex 5. Unfortunately no data consensus workshop could be organized. The expertise that exists at CIAT on this matter is now low.

Observations are

- All comparative overviews of the four subsectors show that the parameters 'Estimated decrease in processing costs' and 'Estimated increase in product price' are most of the times estimated lower than the calculated ones. The difference is a factor two or more, only starch shows a somewhat different picture.
- To starch, flour and fresh roots applies that the total revenues to be get from the three different constraint categories (i.e. root quality, processing technology, and product marketing) are quite equal. Exception to this is processed animal feed. With respect to this, one should notice that revenues from product marketing come from a product price increase only, by questionnaire definition.
- Some of the completed questionnaires are not very consistent, e.g. starch-3 shows very opposite figures in estimated and calculated parameters. Flour-4

showed 0% in both estimated parameters while giving revenues in the calculated parameters! Flour-2 and Flour-5 did not give figures on estimated parameters

Some completed questionnaires did not give us 'appropriate' data respondents did not understand well the concepts of decrease in processing costs nor increase in product price'. In fact, they did not answer according to the instructions. It is clear that the post-harvest questionnaires were more difficult to answer than the production questionnaire. An explanation could be that processing and marketing are more complex issues to think about in terms of constraints, than cultivation is Another factor that may or may not contribute to this observation is the lower scientific attention to post-harvest matters. About 15 years ago CIAT and CIP (Peru) started research in utilization and marketing of root and tuber crops and products. Before that time there was less structured attention to these aspects. Crop production has received research attention for a much longer time.

62 ASIA

6.2.1 CASSAVA ROOT PRODUCTION

With respect to cassava cultivation in Asia a total of eight completed questionnaires were returned Four questionnaires covered parts of humid lowlands, subhumid lowlands and semi-arid lowlands (questionnaire numbers 1-4) The other four questionnaires (numbers 5-8) each covered one climate zone For the continent of Asia no highland climate zone exists. The data are included in this report in Annex 6

No broad data consensus workshop could be organized for Asia Returned questionnaires were reviewed by CIAT's Regional Representative for Asia, Dr Reinhardt Howeler based in Thailand Collaboration from other outposted CIAT staff in Thailand was not received

From the raw data we learn the following

- The discrepancy between Estimated Yield Increase and Calculated Yield Increase is moderate from a factor 1.3 up to 2.1 Discrepancy in individual questionnaires is in both directions in four questionnaires the Estimated parameter is higher than the Calculated one, in the other four questionnaires it is the other way around
- Qtn Number 4 shows very big numbers on almost all constraints. This questionnaire is an outlier and perhaps should not be taken into consideration. No yield gain due to improvement of genetic characteristics was estimated but cassava breeding has been the main activity of the respondent's institute for the past 30 years, so he must believe that better varieties can increase yields!

- The exchange rate used in Qtn Number 7 is clearly incorrect. The correct rate is about 36 rupees per dollar (as indicated for Kerala Qtn Number 4)
- From all completed questionnaires it is very clear that 'Pathogens & Viruses' and 'Pests" play a minor role in Asian cassava cultivation. Most limiting constraint is. Soils & Crop Management' for all climate zones. Then comes "Genetic Characteristics", and after that "Planting Material".
- Qtn Numbers 1 4 have the problem that they cover more than one climate zone The constraint data are not subdivided for the different climate zones only one figure is available for each constraint. In order to make some comparison with the 1993 data possible, a table is included in the comparative overview that shows the shares of climate zones in each of the questionnaires. The table is based on data from Howeler (1996, personal communication)
- Comparing the constraints data in the present study with the data that were collected in 1993 we observe only few differences. The conclusion is that the 1993 data are confirmed by the 1996 data. A good explanation exists in the fact that data were collected among same type of respondents, people at higher responsibility levels. In 1996 data were collected from mostly research institute directors, in 1993 from outposted CIAT staff in Asia.

622 STARCH PRODUCTS

For the post-harvest subsectors in Asia three questionnaires were received. All deal with the production of native starch. In Annex 7 questionnaires and comparative overview are included. A fourth questionnaire is included in the Annex, but is perceived as useless for the analysis of constraints.

All three questionnaires show a strange observation in the Estimated parameters. In two questionnaires a decrease in product price is estimated beforehand, while the questionnaire definition did not allow respondents to do so Here the questionnaire was not interpreted correctly. The other questionnaire showed an estimated increase in processing costs! It means that comparison of Estimated'-parameters with Calculated'-parameters becomes meaningless. Furthermore the given processing costs and product prices seem way off in Kerala and South Vietnam (with no questionnaire number) and seem rather high in Tamil Nadu.

According to the collected data the constraints in starch production in Guangxi China are larger than in India. It stays unclear why such a huge difference in product price increase is given for Kerala and Tamil Nadu. 5 % versus 61 %

7 CONCLUSIONS AND RECOMMENDATIONS

7.1 DATA COLLECTION

7 1 1 SURVEY INSTRUMENTS

From the data collection phase it became clear that the survey instruments were not interpreted correctly by the respondents in all cases. We experienced that in many cases people did not take sufficient time to read the instructions carefully. As a result, double counting and unexpected ('strange') answers occurred. Misinterpretation occurred less when questionnaires were completed with direct supervision of the data collector (as happened partly in the data collection for Latin America), but even then, due to a lack of patience, wrong data were sometimes given.

As we knew at the beginning of the data collection, respondents would need to take good notice of the instructions, pretesting of the questionnaires had revealed this to us. Carefully reading of the instructions eliminates exaggerations by one or other discipline, and makes that everyone interprets the questions in the same way. More than once during the study it was hard to understand why people who want to be taken seriously in their work, have so much difficulty in dedicating time on a survey that directly relates to their own field of work. Related to this problem is the slow return of completed questionnaires. Reminders had to be send to many of the respondents that were given a questionnaire—during the conferences in Brazil and China— to be completed back home. These reactions may be due to a number of factors, not least of these is the relative complexity of the information requested. A solution could be to provide a monetary incentive for people to spend time on completing the questionnaire.

How to solve the conflict between having an appropriate survey instrument and having available something that is quick to complete for a respondent? For a complex issue like constraints and opportunities clear guidelines about what is included in a particular constraint, and what is not included need to be given

The post-harvest questionnaires were subdivided according to processed product and unprocessed product From an analytical viewpoint this is correct Practically it would have been more appropriate to have only one post-harvest questionnaire available. Few questionnaires for fresh roots use were completed and returned. By skipping the processing technology question section in the case of fresh roots, one questionnaire for the post-harvest sector would be sufficient.

In the cassava cultivation questionnaire, a mistake appeared with respect to geographical zoning Initially it was thought that many local respondents, covering a relatively small geographical region, would contribute to the needs assessment. That is why respondents received a map of their country together.

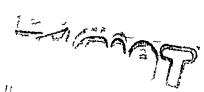

with the questionnaire, on which they were asked to mark the zone to which their constraints information applies, before completing the questionnaire Respondents could define a region according to their knowledge of cassava. It was expected that, in general, the regions to be chosen would not include two or more agro-ecological zones. This would have meant that regions with same agro-ecological characteristics could easily be aggregated for data analysis purposes.

Unfortunately, less local respondents contributed to the study than was foreseen This was especially the case for Asia. It resulted in constraints data covering regions that include more than one agro-ecological zone. These questionnaires are difficult to analyze. A solution to this problem is to define first the different climate zones within a country, and have respondents completing questionnaires per climate zone. Once the new edapho-climatic classification is in use this procedure can be followed for that classification.

7 1 2 TARGET GROUPS / RESPONDENTS

For Latin America we received mostly input from people who work in relatively small geographical regions and/or work on limited subjects. Asia was represented by people who work at a higher, and most often management, level. This leads to a different picture of the data, more about this in the next paragraph. From the viewpoint of user involvement in the constraints assessment, the 'Latino'-way is preferred. But it is necessary then to have a larger number of well-informed, local respondents in order to level out extremes and biases in data. Such a survey design is organizationally difficult to implement and is financially a costly undertaking.

After completing this study it is clear that it is difficult to base a continent-wide needs assessment for a commodity solely on contributions of people that work at a local level. Always consensus in data has to be sought after the data collection phase. User involvement is an important objective in priority setting studies, but not easy to realize. A solution exists in local case studies assess needs for a limited region and then extrapolate for other regions with similar characteristics. With such in-depth studies one gets a precise view of constraints and opportunities for a particular region. Examples of this approach exist in the rapid rural appraisal that was done by the Cassava Biotechnology. Network in Northern Tanzania in October 1993. (Thro. et al., 1994) as well the 'Biotechnology for small and medium scale farmers -project by the Dutch Directorate-General for International Cooperation (DGIS) in the Atlantic Coast Zone of Colombia (Anonymus, 1993)

7.2 CONSTRAINTS AND OPPORTUNITIES

The outcome of the needs assessment study cannot be phrased easily As stated before, data of individual questionnaires relied heavily on the disciplinary orientation of the respondent. This was especially the case for Latin America. Therefore it is not easy to come up with a quantified ranking of needs by agroecological zone for the two continents. Nevertheless, trends can be observed from the data collected, and these are presented in the overviews that precede the individual data sheets in the Annexes.

By comparing the results of the 1993 study with the 1997 study for Latin American cassava root production, we observe some significant differences with respect to the way data collection was done. In the 1993 data collection, relative few input was received from people working with cassava outside CIAT. The people from outside of CIAT that contributed all worked at a high level of abstractness with country-wide responsibilities. Here it concerns contributions made by researchers of EMBRAPA, the Brazilian national agricultural research institute. In the 1997 study much input was received from local respondents, partly by data collection that was done by directly interviewing respondents during the Cassava Conference in Brazil in October 1996. The data consensus workshop that was done in 1993 had more detail than the one in 1997. The 1997 data consensus meeting had more the character of a consistency check.

Therefore the author's feeling is that it would not be right to attach more weight to one study above the other. The 1993 data are presented in a comprehensive format, but the problem of one-sided information is present. The 1997 study does not give a continent-wide picture for all agro-ecological zones, but input from an interesting number of local respondents was received. Therefore the two studies, in 1993 and 1997, are complementary in the assessment of constraints and opportunities in Latin American cassava cultivation, rather than one study having priority above the other. The results of both studies together should be taken as guideline for the research priority setting that has to be done in coming years.

For post-harvest subsectors in both Latin America and Asia, the present study serves well the objective of assessment of needs on a continent-wide scale Unfortunately no review panel could be found to evaluate the data. They do, however give a good impression of limiting factors in the production of a number of cassava products. The study that was done in 1993 hardly gives any specified data for constraints in the post-harvest phase of cassava.

The constraints and opportunities that are assessed for Asian cassava cultivation show much similarity to the data presented in 1993 by CIAT's Cassava Program. The obvious reason is that the same type of respondent acted in both the 1993 and 1997 study people working at a higher level. The conclusion is that the use of same survey instruments delivers consistent data over time. With respect to the objective in the present study regarding involvement of local respondents.

data collection thus was not optimal. The survey instruments were presented during a 30 minutes' plenary session in the China conference in November 1996. Respondents took home the questionnaires and completed them at a much later date.

What recommendations can be given for a next needs assessment? First and foremost collaborators have to be convinced about the usefulness of such a study. A lack of interest frustrates heavily any type of needs assessment. One might expect that in a situation of decreasing financial resources available to agricultural research and development, the importance of a thorough needs assessment is clear to anyone.

An option for a future needs assessment is to appoint for each important cassava producing country a national institute that will be responsible for the country's needs assessment. This institute should organize local committees that start with a data inventory like the one done in this study, perhaps with survey instruments that are modified according to the local situation. After that all collaborators are invited for a data consensus workshop. Once the local assessment is completed, all local committees in a country meet together and discuss a national needs assessment for the different agro-ecological zones in the country.

Aggregation of country' assessments has to be done by an entity that is not directly interested in the results of the assessment and its financial consequences in order to increase the credibility of the needs assessment it may be necessary to have a consortium of financial donors that backs the work, and that is able to motivate local partners to collaborate with such a study. The question is who pays? Although the costs may be high, the long term pay off to undertaking research and development activities based on a clearly defined and agreed upon set of priority constraints and opportunities would be substantial

SPECIAL PROJECT PRIORITY AREAS FOR CASSAVA RESEARCH Constraints & Opportunities in CASSAVA CULTIVATION

Background.

The Cassava Biotechnology Network (CBN) is involved in a special project on priority setting for cassava research, technically supported by CIAT's Cassava Program. The CBN project coincides with the recently initiated Cassava Global Strategy Development by the International Fund for Agricultural Development (IFAD). One of the projects in this initiative include Regional Reviews of the cassava subsectors in Africa, Asia and Latin America. It is expected that the current data collection scheme will provide a comprehensive overview of constraints and opportunities in the cassava subsectors worldwide. IFAD has provided partial funding to conduct this survey.

During the Fifth Asian Regional Cassava Workshop, data collection for the needs assessment regarding Asia is planned. For this objective two questionnaires have been designed, one on cultivation constraints and one questionnaire on post-harvest issues. The latter questionnaire is subdivided in processed cassava products and fresh consumed cassava. The questionnaire attached deals with cassava cultivation.

The questionnaire, and how to complete it

Annexed you find a questionnaire (in table format) on constraints and opportunities in cultivation of cassava. The questionnaire has a matrix design, you should link rows with columns to know what information is asked for. Please refer in your answers to the situation over the last five years. Fill out according to the average conditions during this time period (Please don't take very exceptional circumstances into account, i.e. situations that you may expect not to occur again within 10 years from now). The reference point with respect to location of the cassava plant is, naturally, the farm. The questionnaire targets all farms on which cassava is produced, in the geographic area you are knowledgeable about (see paragraph II hereunder). In areas where cassava is intercropped please think of the yield that would have been obtained in case cassava was monocropped under similar conditions. Take this mono crop yield when thinking about yield gains due to alleviation of constraints. The reason for conversion of the yield is to make cassava yields and yield gains comparable between different areas.

The first, very crucial, question (with code 0.1) is about your coverage of cassava cultivation areas, i.e. cassava distribution. Please think well about the geographic area for

which you are able to provide confident data, i.e. the area that is within your field of expertise or experience. Complete the questionnaire for that specific region. Note that we are looking for good quality data, not necessarily a big geographic area that is covered by an individual questionnaire.

- III Next you find questions (codes 0 3 0 6) on quantities and selling prices regarding the cassava varieties under consideration—you are asked to complete the questionnaire for from two to four of the main varieties that are grown in the geographic area that you have mentioned under code 0.1
- IV After the general questions, the questionnaire is subdivided into six constraints sections. Planting material (code 1.1 1.5), Pathogens & viruses (code 2.1 2.11), Pests (code 3.1 3.10), Genetic characteristics (code 4.1 4.11), Soils & crop management (code 5.1 5.13) and Non-crop related constraints (code 6.1 6.7). Each section should be viewed as a whole. In the first (i) column, you are asked to compare the constraints within the whole section. The second (ii) and third (iii) column are aimed at quantification of individual, independent constraints. Cells in blank have to be filled out.
- On behalf of CBN and IFAD, I thank you for your time and effort completing the questionnaires!! We'll make sure that you receive a copy of the results

Specific notes, only where necessary

- Code 0.1 Please fill in the geographic area (department, country, region) for which you complete this questionnaire
- Code 0.2 Please give the total area (in hectares) that is planted to cassava for the geographic area for which you answer this questionnaire
- Code 0.3 Average yield in Ton/Ha, or in local unit (please give conversion to Ton/Ha)
- Code 0.4 Please give the maximum cassava yield that is technically feasible, i.e. in case all constraints are relieved
- Code 0.5 Farmgate price in local currency per metric ton (or per local unit, if so, please give conversion to MT)
- Code 0.6 Local currency into US dollar (1996)
- Code 1.1 This is a section on constraints regarding planting material
- Code 1 2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1 is most severe 2 is second most severe, etc., etc.

- II) SHARE OF CULTIVATED AREA THAT IS AFFECTED BY A CONSTRAINT The share (in %) of the total cassava area that is affected by each constraint III) ROOT YIELD GAIN ONCE THE CONSTRAINT HAS BEEN REMOVED Please give the percentage (%) increase in root yield due to the alleviation of a constraint
- Code 1.3 Stakes that are too short, too thin, not fresh anymore, or that have too few nodes

- Code 1.4 The quantity of stakes is not sufficient to obtain the preferred plant density, i.e. the maximum yield level
- Code 1.5 Please specify other constraint(s)
- Code 2.1 This section includes pathogens and viruses
- Code 2.2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity. It is most severe, 2 is second most severe, etc., etc.

II) SHARE OF CULTIVATED AREA THAT IS AFFECTED BY A CONSTRAINT The share (in %) of the total cassava area that is affected by each constraint III) ROOT YIELD GAIN ONCE THE CONSTRAINT HAS BEEN REMOVED Please give the percentage (%) increase in root yield due to the alleviation of a constraint

- Code 2.5 Please specify type. African or East-African or Indian
- Codes 2 6 2 7, 2 9 2 10 Please specify other constraints
- Code 3.1 This section deals with pests
- Code 3.2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1 is most severe, 2 is second most severe, etc., etc.

II) SHARE OF CULTIVATED AREA THAT IS AFFECTED BY A CONSTRAINT The share (in %) of the total cassava area that is affected by each constraint III) ROOT YIELD GAIN ONCE THE CONSTRAINT HAS BEEN REMOVED Please give the percentage (%) increase in root yield due to the alleviation of a constraint

- Codes 3 8 3 10 Please specify other constraints
- Code 4.1 Here the genetic, i.e. intrinsic, characteristics of cassava varieties/landraces cultivated in your geographical area (code 0.1) are targeted
- Code 4.2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1 is most severe, 2 is second most severe, etc., etc.

- II) SHARE OF CULTIVATED AREA THAT IS AFFECTED BY A CONSTRAINT The share (in %) of the total cassava area that is affected by each constraint III) ROOT YIELD GAIN ONCE THE CONSTRAINT HAS BEEN REMOVED Please give the percentage (%) increase in root yield due to the alleviation of a constraint
- Code 4.8 Wide canopy causing competition with intercrops
- Codes 4 9 4 11 Please specify other constraints
- Code 5.1 This section covers constraints in the direct environment (SOILS) and treatment (CROP MANAGEMENT) of the cassava crop
- Code 5 2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1

- is most severe, 2 is second most severe, etc., etc.
- II) SHARE OF CULTIVATED AREA THAT IS AFFECTED BY A CONSTRAINT The share (in %) of the total cassava area that is affected by each constraint III) ROOT YIELD GAIN ONCE THE CONSTRAINT HAS BEEN REMOVED Please give the percentage (%) increase in root yield due to the alleviation of a constraint
- Code 5.3 A soil type with a poor chemical capacity to make sufficient nutrients available to the crop
- Code 5.4 A soil type with poor physical properties, so that a plant cannot grow and develop fully. We assume that this constraint cannot be easily alleviated by men. Example, big rocks, etc.
- Code 5.5 Degradation of soil (=decreased nutrient availability) due to erosion
- Code 5.9 Field management includes a omulching, ridging, irrigation, and fertilization Sub-optimal land management does not have to do with poor soil physics (code 5.4)
- Code 5 10 Inter-plant (cassava or intercrop) distance is too small or too big
- Code 5 11 Crop care includes weed and pest control both chemically and manually
- Codes 5 12 5 13 Please specify other constraints

a constraint

- Code 6.1 The last, sixth section is about constraints that are not directly related to the physical crop, but have to do with socio-economic circumstances in cassava cultivation.
- Code 6 2

 1) SEVERITY RANKING

 Please rank the constraints for the section as a whole in order of severity 1

 IS most severe, 2 is second most severe, etc , etc

 II) SHARE OF CULTIVATED AREA THAT IS AFFECTED BY A CONSTRAINT

 The share (in %) of the total cassava area that is affected by each constraint

 III) ROOT YIELD GAIN ONCE THE CONSTRAINT HAS BEEN REMOVED

 Please give the percentage (%) increase in root yield due to the alleviation of
- Code 6.3 Credit to buy all types of inputs (planting material, fertilizers, pesticides, etc.) Codes 6.6 6.7 Please specify other constraints

SPECIAL PROJECT PRIORITY AREAS FOR CASSAVA RESEARCH Constraints & Opportunities in PROCESSED CASSAVA PRODUCTS

Background

The Cassava Biotechnology Network (CBN) is involved in a special project on priority setting for cassava research, technically supported by ClAT's Cassava Program. The CBN project coincides with the recently initiated Cassava Global Strategy Development by IFAD. One of the projects in this initiative include Regional Reviews of the cassava subsectors in Africa, Asia and LatinAmerica. It is expected that the current data collection scheme will provide a comprehensive overview of constraints and opportunities in the cassava subsectors worldwide. IFAD has provided limited funding to conduct this survey.

During the Fifth Asian Regional Cassava Workshop, data collection for the needs assessment regarding Asia is planned. For this objective two questionnaires have been designed, one on cultivation constraints and one questionnaire on post-harvest issues. The latter questionnaire is subdivided in processed cassava products and fresh consumed cassava. The questionnaire attached deals with processed cassava products.

The questionnaire, and how to complete it.

I Annexed you find a questionnaire (in table format) on constraints and opportunities in consumption, processing and commercialization of processed cassava products. Processed cassava products include cassava root (or leaf) that is being processed before consumption. The questionnaire has a matrix design, you should link rows with columns to know what information is asked for. Please refer in your answers to the situation over the last year. The reference point with respect to location of the product is the processing unit. The questionnaire targets all processing units in your geographic area (be it part of a farm or be it an independent unit), and targets in the marketing section the products that are commercially sold.

If the first, very crucial, question (with code 0.1) is about your coverage of cassava production and consumption areas. Please think well about the geographic area for which you are able to provide confident data, i.e. the area that is within your field of expertise or experience. Complete the questionnaire for that specific region. Note that we are looking for good quality data, not necessarily a big geographic area that is covered by an individual questionnaire.

III Next vou find a choice option for a cassava product (code 0.2) For each product that you are able to complete a questionnaire you fill out a separate form. This is because we don't want information about different products to be mixed up. The following cassava products are distinguished. Native Starch for Human Consumption, Native Starch for Industrial Purpose, Modified Starch, Chips for Human Consumption. Chips for Animal Feed, and Pellets for Animal Feed. You are asked to complete the questionnaire for the type of cassava product that you have marked.

IV Then follow some questions on quantities, processing costs, and prices, regarding the cassava product under consideration (codes 0.3 up to 0.11)

V After the general product questions the questionnaire is subdivided into three constraints sections root quality (code 1 1 - 1 13), processing technology (code 2 1 - 2 13), and product marketing (code 3 1 - 3 11). Each section should be viewed as a whole. In the first (i) column, you are asked to compare the constraints within the whole section. The second (ii) third (iii), and fourth (iv) column are aimed at quantification of individual, independent constraints. Due to the fact that the same questionnaire is used for different products, some constraints don't apply for certain products.

On behalf of CBN and IFAD, I thank you for your time and effort completing the questionnaires!! We'll make sure that you in time receive a copy of the results

Specific notes.

- Code 0.1 Please fill in the area (department, country, or region) for which you complete this questionnaire
- Code 0.2 Please mark one product This cassava product portfolio is subdivided according to final destination of the product Please give the local name of the product, with a short description of the processing steps. Use the blank space at the bottom of the page
- Code 0.3 Please give the total volume of consumption (in 000 MT) for the geographic area mentioned under code 0.1
- Code 0.4 Please give the conversion rate (root into product) for the product under consideration (Number of tons of fresh cassava required to produce one Ton of the product.)
- Code 0.5 Please give the price of fresh roots entering the processing unit for the product under consideration. Due to differences in required quality, fresh root prices may vary according to destination. AVERAGE means the average price over the last year for the raw material.
- Code 0 6 Current processing costs (not including raw material costs) under all current constraints. Current constraints for example are the partial inefficient use of available labour time, the non-efficient input of capital, etc.
- Code 0.7 The optimal, lowered processing costs if, through root quality improvement (for example dry matter) and/or technology advance (for example reduction in process losses) all relevant constraints have been removed

- Code 0.8 Conversion of local product unit into kg (only when a local unit was used before, in codes 0.6 and 0.7)
- Code 0.9 Average factory price for the commercialized product, under current constraints AVERAGE means the average price over the last year (Factory = Processing unit)
- Code 0 10 The optimal, altered factory price, that would reflect price premiums as a result of (a) root quality improvement and/or (b) processing technology improvement and/or (c) market development Example A low fibre content, a better product quality obtained in the processing stage and less price fluctuations in the product market altogether would provoke a 50 % price premium for the product leaving the factory
- Code 0 11 Local currency into US dollar (1996)
- Code 1.1 This section deals with quality aspects of cassava roots
- Code 1 2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1 is most severe, 2 is second most severe, etc., etc.

- II) SHARE OF PRODUCT VOLUME THAT IS AFFECTED BY A CONSTRAINT Please give the share (in %) of the total product volume in your geographic area that is affected by each constraint
- III) REDUCTION IN PROCESSING COST ONCE THE CONSTRAINT HAS BEEN REMOVED

Please give the percentage reduction in processing costs due to the alleviation of a constraint through root quality improvement

IV) PREMIUM ON PRODUCT PRICE ONCE THE CONSTRAINT HAS BEEN REMOVED

Please give the percentage increase in product price due to root quality improvement

- Code 1.3 High cyanogen content that leads to an additional cost in one of the processing stages with a negative effect on profits
- Code 1.4 Low dry matter content in the root
- Code 1.5 This constraint applies to products made from roots and aims at physiological and microbial perishability
- Code 1.6 High fibre content in the root
- Code 1.7 Starch that is less appropriate for the processing steps under consideration
- Code 1.8 These are characteristics that are not preferred by consumers
- Code 1.9 Unusual root size/shape which incurr higher costs for peeling and slicing
- Codes 1 10 1 13 Please specify other constraints
- Code 2.1 This question section is about equipment and management in the various processing stages
- Code 2 2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1 is most severe, 2 is second most severe, etc., etc.

- (i) SHARE OF PRODUCT VOLUME THAT IS AFFECTED BY A CONSTRAINT Please give the share (in %) of the total product volume in your geographic area that is affected by each constraint
- III) REDUCTION IN PROCESSING COST ONCE THE CONSTRAINT HAS BEEN REMOVED

Please give the percentage reduction in processing costs due to the alleviation of a constraint through processing technology improvement

IV) PREMIUM ON PRODUCT PRICE ONCE THE CONSTRAINT HAS BEEN REMOVED

Please give the percentage increase in product price due to processing technology improvement

- Code 2.3 Targets damaged roots, caused by maltreatment from harvest up to entering the processing unit
- Code 2.4 Low product quality, caused in the processing stage. Please specify the reason for the low quality. Eg. lack of quality control measures (management problem), or outdated equipment (technical problem).
- Code 2.5 Targets the efficiency of the technology (modern or old) that is used reconversion of the raw material
- Code 2.6 Targets the efficiency in the use of capital (represents for a part 'processing cost'). Inefficient capital use relates to outdated, not properly designed equipment, with a high energy consumption.
- Code 2.7 Targets the efficiency in the use of labour (represents for a part 'processing cost'). Inefficient labour use relates to bad organization of the work or in case only unskilled workers are available.
- Code 2.8 Contaminated water
- Code 2.9 An excess use of water in processing causes higher costs for waste water treatment (which is obligatory now or soon in many countries). Higher costs for waste water treatment are reflected in a lower product price. So, the question here is when less water is used what would be the product price premium?
- Codes 2 10 2 13 Please specify other constraints
- Code 3.1 This section focuses on the marketing of processed cassava products. Own consumption at the processing unit is not taken into account here.
- Code 3 2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1 is most severe, 2 is second most severe, etc

- II) SHARE OF PRODUCT VOLUME THAT IS AFFECTED BY A CONSTRAINT Please give the share (in %) of the total product volume in your geographic area that is affected by each constraint
- III) REDUCTION IN PROCESSING COST ONCE THE CONSTRAINT HAS BEEN REMOVED Not Applicable

Constraint alleviation in product marketing has effect on product price only iv) PREMIUM ON PRODUCT PRICE ONCE THE CONSTRAINT HAS BEEN

REMOVED

- Please give the percentage increase in product price due to market development
- Code 3.3 Bad packaging material and/or poor packaging by factory workers which makes the product less attractive as it could be
- Code 3.4 The loss in product value (product damage) from processing unit up to the consumer
- Code 3.5 Examples are bad roads, no trucks available, cuts in water and energy supply, and few buyers at the processing unit. These have a decreasing effect on product price, and on market functioning in general.
- Code 3 6 MANY INTERMEDIARIES means a long marketing channel and high marketing margins, in general
- Code 3.7 Price fluctuations that prevent a market to develop and include a risk to producers, the absence of severe price fluctuations opens the opportunity for increased product supply (less risk!)
- Codes 3 8 3 11 Please specify other constraints

SPECIAL PROJECT PRIORITY AREAS FOR CASSAVA RESEARCH Constraints & Opportunities in FRESH CONSUMED CASSAVA

Background

The Cassava Biotechnology Network (CBN) is involved in a special project on priority setting for cassava research, technically supported by CIAT's Cassava Program. The CBN project coincides with the recently initiated Cassava Global Strategy Development by IFAD. One of the projects in this initiative include Regional Reviews of the cassava subsectors in Africa, Asia and LatinAmerica. It is expected that the current data collection scheme will provide a comprehensive overview of constraints and opportunities in the cassava subsectors worldwide. IFAD has provided limited funding to conduct this survey.

During the Fifth Asian Regional Cassava Workshop, data collection for the needs assessment regarding Asia is planned. For this objective two questionnaires have been designed, one on cultivation constraints and one questionnaire on post-harvest issues. The latter questionnaire is subdivided in processed cassava products and fresh consumed cassava. The questionnaire attached deals with fresh consumed cassava.

The questionnaire, and how to complete it.

- Annexed you find a questionnaire (in table format) on constraints and opportunities in consumption and commercialization of fresh consumed cassava. Fresh consumed cassava is cassava root (or leaf) that is not being processed before consumption. The questionnaire has a matrix design, you should link rows with columns to know what information is asked for. Please refer in your answers to the situation over the last year. The reference point with respect to location of the product is the farm. The questionnaire targets all farms in your geographic area on which cassava is cultivated, and targets in the marketing section the roots (and leaves) that are sold commercially
- If the first, very crucial, question (with code 0.1) is about your coverage of cassava production and consumption areas. Please think about the geographic area for which you are able to provide confident data, i.e. the area that is within your field of expertise or experience. Complete the questionnaire for that specific region. Note that we are looking for good quality data, not necessarily a big geographic area that is covered by an individual questionnaire.

III Next you find a choice option for a cassava use (code 0.2) For each cassava use you fill out a separate form. This is because we don't want information about different cassava uses to be mixed up. In fresh consumed cassava the following uses are distinguished: tresh roots for human consumption (boiled fried, or raw eaten), fresh roots for animal feed (no drying of roots), leaves for human consumption (utilized as a cooked vegetable), and leaves for animal feed. You are asked to complete the questionnaire for the type of cassava use that you have marked

IV Then follow some questions on prices and quantities regarding the cassava use under consideration (codes 0.3 up to 0.6)

V After the general product questions the questionnaire is subdivided into two constraints sections root (or leaf) quality (code 1.1-1.13) and marketing (code 2.1-2.9). Each section should be viewed as a whole. In the first (i) column, you are asked to compare the constraints within the whole section. The second (ii) and third (iii) column are aimed at quantification of individual constraints. Due to the fact that the same questionnaire is used for different cassava uses, some constraints don't apply for certain cassava uses.

On behalf of CBN and IFAD, I thank you for your time and effort completing the questionnaires!! We'll make sure that you in time receive a copy of the results

Specific notes

- Code 0.1 Please till in the area (department, country, or region) for which you complete this questionnaire
- Code 0 2 Please mark one
- Code 0.3 Please give the total volume of consumption (in 000 MT) for the geographic area mentioned under code 0.1
- Code 0.4 Average farm-gate price for the commercialized product, under current constraints AVERAGE means the average price over the last year
- Code 0.5 The optimal, altered farm-gate price, that would reflect price premiums as a result of root quality improvement and/or market development. An example Toxic roots and market distortions are the only constraints in a certain situation. Removal of cyanogen together with full market competition would provoke a 40 % price premium for the product at the farm-gate.
- Code 0.6 Local currency into US dollar (1996)
- Code 1.1 This section deals with root quality, or leaf quality. Root characteristics for uses: 'fresh roots for human consumption' and 'fresh roots for animal feed', leaf characteristics for uses: 'leaves for human consumption' and leaves for animal feed'.
- Code 1.2

 i) SEVERITY RANKING

 Please rank the constraints for the section as a whole in order of severity 1

 is most severe, 2 is second most severe, etc., etc.

 ii) SHARE OF PRODUCT VOLUME THAT IS AFFECTED BY A CONSTRAINT.

The share (in %) of the total product volume that is affected by each constraint

- III) PREMIUM ON PRICE ONCE THE CONSTRAINT HAS BEEN REMOVED. The percentage increase in price due to root (or leaf) quality improvement.
- Code 1.3 High cyanogen content that limits in one way or another the use of roots
- Code 1.4 Low dry matter content in the root
- Code 1.5 This constraint aims at physiological and microbial perishability
- Code 1.6 High fibre content in the root
- Code 1.7 Cassava roots that are not well suited for cooking
- Code 1.8 High fibre content in the root
- Code 1.9 Unusual root size/shape which incurr higher costs for peeling
- Codes 1 10 1 13 Please specify other constraints
- Code 2.1 This section focuses on the marketing of fresh consumed cassava. Own consumption is not taken into account here
- Code 2 2 i) SEVERITY RANKING

Please rank the constraints for the section as a whole in order of severity 1 is most severe, 2 is second most severe, etc., etc.

- II) SHARE OF PRODUCT VOLUME THAT IS AFFECTED BY A CONSTRAINT. The share (in %) of the total product volume that is affected by each constraint.
- III) PREMIUM ON PRICE ONCE THE CONSTRAINT HAS BEEN REMOVED. The percentage increase in price due to market development.
- Code 2.3 Examples are bad roads, no trucks available, and few buyers at the processing unit. These have a decreasing effect on product price, and on market functioning in general.
- Code 2.4 MANY INTERMEDIARIES means a long marketing channel and high marketing margins, in general
- Code 2.5 Price fluctuations that prevent a market to develop and include a risk to producers, the absence of severe price fluctuations opens the opportunity for increased product supply (less risk!)
- Codes 2 6 2 9 Please specify other constraints

EDAPHO-CLIMATIC CLASSIFICATION OF CASSAVA PRODUCTION FOR LATIN AMERICA AND ASIA

Proposal presented to the International Fund for Agricultural Development (IFAD), Italy, as part of the Cassava Global Strategy Development by Cassava Biotechnology Network (CBN) and Land Use Project (LUP),

Cassava Biotechnology Network (CBN) and Land Use Project (LUP), International Center for Tropical Agriculture (CIAT), Colombia

March 1997

BACKGROUND

In May 1996 the initiative for the development of a global strategy for cassava was launched by IFAD during a planning meeting in Rome, Italy. Working groups were established to undertake regional reviews or cassava subsectors. One of the activities in the regional reviews include the assessment of constraints in cassava production and post-harvest sectors.

Constraints in the cultivation of cassava many times are related to climate and soil type of the environment in which cassava is produced. Research approaches also are based on subsets of climate and soil types. This implies that an inventory of constraints in cassava must be preceded by a proper classification of cassava production zones. Although the Cassava Global Strategy Development chose to work with regional reviews, the criteria for classification of production zones should be uniform among the three cassava growing continents in order to make comparison and summation of constraints possible at the global level.

A classification of cassava production based on climate and soil type has been made for the continent of Africa (Carter et al., 1992). The resulting edapho-climatic classification is specific to cassava cultivation circumstances. The classification criteria are derived from a set of climate and soil conditions for cassava cultivation that cover the production of cassava at the global level. Furthermore, the Africa classification is well-documented, referenced and contains exclusive classes that are not ambiguous.

Four criteria for climate conditions were applied mean growing season temperature, dry season, daily temperature range, and seasonality. For soil type eight classes were

distinguished depending on soil texture, drainage problems, and acidity, among others. The 128 classes that resulted were grouped into seven main edapho-climatic classes for cassava production.

OBJECTIVES

This proposal aims at preparation of edapho-climatic classification for cassava production in Latin America and Asia. The criteria for classification are similar to the ones in the classification that was prepared for Africa before

Second objective is to distribute the classifications to national cassava research institutes in order to streamline research initiatives and strengthen interaction

METHODOLOGY

The Land Use Project at CIAT is responsible for the preparation of edapho-climatic classification of cassava production. The classification for Asia requires the production of an interpolated climate file. We will extract topographic data from the NOAA 10 minute digital elevation model. Then using inverse square distance weighing and correction for lapse rate the rainfall, temperature and diurnal temperature range for each pixel are estimated from the 5 nearest stations. Approximately 3500 stations are available from the CIAT Climate database. A Fortran program is then used to read the monthly values for each pixel and assign the climate classification class. An IDRISI image is formed of the climate classes. This image is then overlaid on soil conditions in ARC/INFO using the digital version of the FAO Soils map of the world at 1 5 000,000. This procedure will probably not produce good results for certain small islands but should be robust for mainland Asia and the larger islands.

The distribution of maps with edapho-climatic classification will be the responsibility of CBN. The data base of CBN will be utilized to get a good coverage in the distribution of maps among national, and other, research entities all over the world.

TIME FRAME

The edapho-climatic classification for Latin America has been prepared in July 1996, shortly after the start of the Global Strategy Development. This took about two days of CIAT Senior Staff time.

The preparation of the classification for Asia will take three weeks time of a LUP Associate, and three weeks time of LUP Senior Staff. The work can be done at any moment since the necessary data are already available at CIAT, the only thing is that it has to fit in with other activities in the Land Use Project. It is expected that the work is completed before July 1997.

Distribution of maps is scheduled for August 1997

EXPECTED PRODUCTS

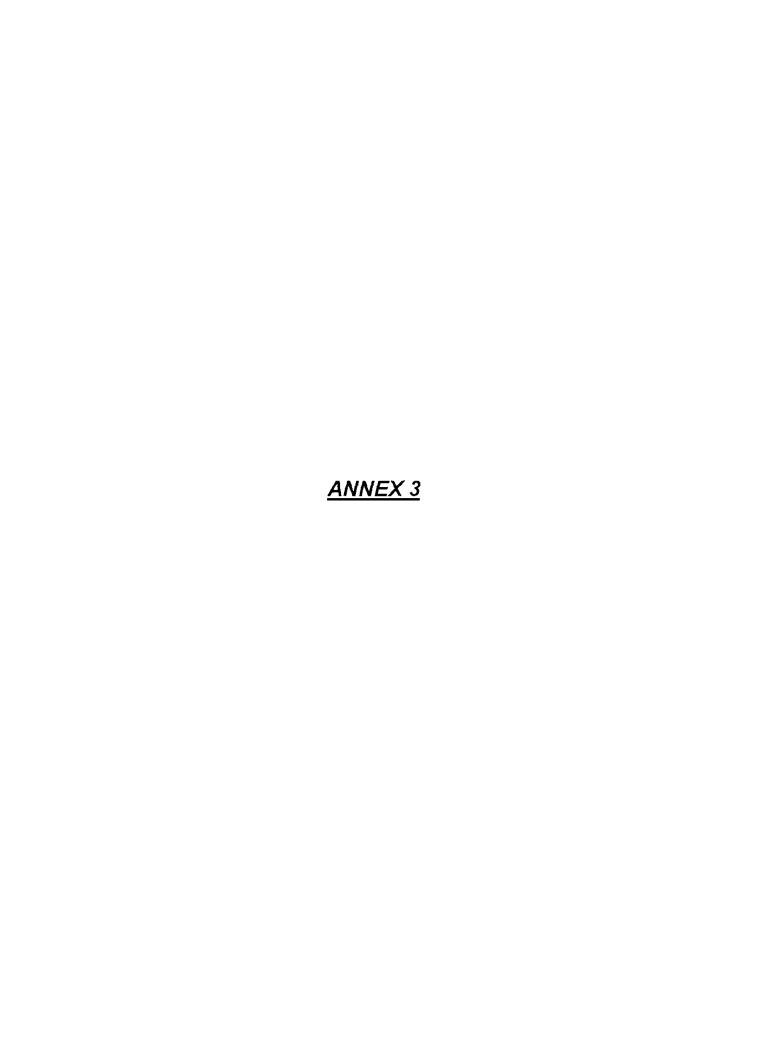

A classification system that covers cassava production worldwide will be available. The classification serves a wide range of purposes. First of all it is going to be used in the regional reviews for the Global Strategy, but thereafter international research centers as well as national research institutes may make use of the classification system in that they base their cassava research policy on a scientifically sound classification system. Researchers worldwide will interact based on one, common platform for cassava classification. A proper identification of target zones for cassava research initiatives will encourage progress in cassava research.
