CENTRO INTERNACIONAL DE AGRICULTURA  
TROPICAL, PROYECTO REGIONAL DE FRIJOL  
PARA CENTROAMERICA Y EL CARIBE.  
FINANCIADO POR LA CORPORACION SUIZA DE  
DESARROLLO C O S U D E

ESTE ES UN RESUMEN DE LOS RESULTADOS  
DE LA INVESTIGACION EN MUSTIA  
HILACHOSA DEL FRIJOL (THANATEPHORUS  
CUCUMERIS (FRANK) DONK), REALIZADA  
POR LOS CIENTIFICOS DE LOS PROGRAMAS  
NACIONALES DE FRIJOL DE CENTRO  
AMERICA, PANAMA, MEXICO, EL CARIBE,  
SUR AMERICA Y EL CENTRO  
INTERNACIONAL DE AGRICULTURA  
TROPICAL, (CIAT).

# VIVERO INTERNACIONAL DE MUSTIA HILACHOSA

## INTRODUCCION

Guillermo Gálvez E

Los resultados de los Viveros Nacionales o Internacionales no tienen ningún sentido si sus resultados no se publican para beneficio de los investigadores del frijol. Esta publicación debería darse a la luz tan pronto se obtienen, y, en el caso de Mustia, desafortunadamente, no ha sido así. Esperamos con esta publicación iniciar las publicaciones anuales de los resultados del Vivero Internacional de Mustia (VIM), y, al hacer entrega de los resultados desde 1977 hasta 1985 es nuestro deseo contribuir a un mejor conocimiento de los genes de "tolerancia" existentes en varias fuentes de *Phaseolus vulgaris*, y, en los nuevos materiales que han resultado de la incorporación de estos genes, y, en la formación piramídica de los mismos, para obtener un control más eficiente de la Mustia Hilachosa en frijoles con mejor adaptación, arquitectura, y, con resistencia a otras enfermedades.

## **OBJETIVO GENERAL**

El Vivero Internacional de Mustia Hilachosa (VIM) tiene por objeto evaluar los niveles de resistencia o tolerancia de las variedades y/o líneas avanzadas a la mustia hilachosa *Thanatephorus cucumeris* Frank (Donk), en diversas zonas geográficas de Centro América, México, Panamá, El Caribe y Sur América, con el fin de buscar genes que puedan ser incorporados en variedades comerciales en los diferentes países donde la enfermedad es un factor limitante de la producción

## MANEJO DEL VIVERO: 1973 - 1985

### METODOS

La metodología seguida para la siembra del Vivero Internacional de Mustia ha variado a través de los años. Del año 1974 - 1982 los materiales fueron sembrados en las épocas de mayor infeccción con tres repeticiones randomizadas, usando treinta semillas en surcos de 3 m. Después de cada cinco surcos de prueba se sembró un testigo susceptible y después de 20 surcos se colocó un testigo tolerante, entre dos testigos susceptibles, alternando con otro testigo tolerante y así sucesivamente. En cada repetición se sembró un marco con dos surcos esparciadores del inóculo usando una variedad susceptible. En la siembra de 1982 B se aumentó el tamaño del surco a cuatro metros y cada cinco surcos de prueba se sembró un testigo susceptible.

En 1983 se trabajó de nuevo con surcos de tres metros con una distancia entre ellos de 50 cm. El vivero se inició con un material tolerante (Porrillo 70, Turrialba 1, Talamanca) seguido de un testigo susceptible (Rojo de seda, México 80 e ICA L.24) y luego otro tolerante. Después de cada veinte surcos se repitió la siembra de un surco tolerante seguido de un susceptible y un tolerante. Se colocaron tres repeticiones completamente randomizadas.

En el año 1984 se sembró, al igual que en el año anterior, en surcos de tres metros de largo con treinta semillas cada uno, separados 50 ó 60 cm , con tres repeticiones por material sin aleatorizar, pero con un testigo susceptible y uno tolerante cada cuatro materiales en estudio El vivero se inició con un material susceptible (BAT 1155, Calima, ICA L.24) junto con un tolerante (Talamanca, Porrillo 70)

En 1985 el testigo susceptible y el tolerante se sembraron cada seis surcos, y, se utilizaron cuatro repeticiones aleatorizadas

## EVALUACIONES

Se realizaron de tres a cuatro evaluaciones, a los 15, 25, 35 y 45 días después de la siembra tomando notas de severidad de tejido afectado por la enfermedad en las plantas de todo el surco. El total de tejido vegetal se considera 100% la mayoría compuesto por hojas y vainas. La evaluación de las líneas en prueba se hicieron comparándolas con los testigos más cercanos, debido a que la distribución de la enfermedad en el campo es muy variable tanto por la desuniformidad del terreno como de la distribución del inóculo.

Además de estas pruebas se determinaron los componentes de rendimiento, adaptación vegetativa y reproductiva, sin embargo, estos datos no se incluyen debido a que no fue reportado uniformemente en todos los viveros.

A continuación se presentan las escalas utilizadas para la evaluación de la mustia hilachosa bajo condiciones de campo

1974 - 1981

T Material tolerante

S Material susceptible

1982

Grado de reacción al patógeno / Severidad
