FOREWORD

Centro Internacional de Agricultura Tropical (CIAT) is an international research and training center aimed at accelerating agricultural and economic development in the lowland tropics.

Research aimed at increasing production and productivity of cassava is one of the principal activities carried out by the Center.

The present report makes available a compilation of secondary data on area, production and yields of cassava and analyses recent historical trends in per capita cassava production in 82 countries.

Being the first of a series of studies to be carried out on cassava by the Program of Agricultural Economics, it is aimed at providing cassava researchers with easy access to basic statistical information.

Studies on cassava production systems, price fluctuations and future demand potential for cassava are in progress and will be published upon completion.

Comments and suggestions with respect to this report and future research needs would be appreciated.

Per Pinstруп Andersen
Leader, Program of
Agricultural Economics

ACKNOWLEDGMENT

The elaboration of this study was guided by Gerald I. Trant and Per Pinstруп-Andersen.

The diagrams were done by Maria Eugenia Alvarez and Armando Martínez.

The collaboration of these and other persons who assisted in this study is acknowledged.

INTRODUCTION

Although cassava is an important source of carbohydrates for the population of a large number of tropical countries, research aimed at increasing the production and productivity of this crop has been relatively scarce.

The objective of this report was to recompile certain basic data on the production of cassava and analyze past trends of the relationship between cassava production and population for each of the cassava producing countries.

DATA SOURCES

Basic data were obtained from statistical bulletins issued by the Food and Agricultural Organization of the United Nations (FAO) and the General Agreement on Tariff and Trade (GATT).

Definitions

The following symbols are used in the tables:

- None or a negligible quantity (less than one-half of the unit indicated) or entry not applicable.

... Data not available.

To divide the decimals from the whole number, a period (.) is used. For a number of African countries, the term "Farms and Estates" refers to enterprises mainly operated on a commercial basis and adequately covered

by the agricultural surveys. "Villages" refer to small farms utilizing traditional production methods.

METHODOLOGY

The tendency in the production of cassava per capita was estimated by simple linear regression, utilizing the equation $y = a + bx$, where "y" is production per capita in kilograms and "x" is a code for years. The coefficient "a" expresses estimated production per capita in kilograms in the year prior to the first year for which information was available. The coefficient "b" indicates the change in per capita cassava production in kilograms per year during the period under consideration.

Some of the countries analyzed show a definite trend during part of the period for which data were available, but not for the whole period. An additional regression analysis including only the years for which a trend was apparent was carried out for these countries. The regression line referring to the total period is indicated by a full line while the partial regression line is shown by a broken line. As indicated by the correlation coefficient (R^2), some of the countries show such large annual production fluctuations that no trend was apparent.

MAJOR FINDINGS

The area planted with cassava shows an increasing trend of about 200,000 hectares per year during the period under consideration (Table 45).

The largest increases are found in Africa and South America with annual increases of 480,000 and 124,000 hectares, respectively.

World cassava production likewise shows an upward trend. During the period under consideration, world production increased by approximately two million metric tons annually, again with Africa and South America being the major contributors. World cassava yields showed no change during the period (Table 46). Africa shows a decreasing yield trend of about 110 kg/ha. annually while an increasing trend of 90 kg/ha. was estimated for South America. The production per capita increased by approximately 7.5 kilograms annually in South America but decreased for the rest of the world. World production per capita appears to have been constant during the period 1963-68.

About 40 percent of the total world production of cassava comes from South America (Table 27) and is produced on about 25 percent of the world cassava area planted (Table 15). Africa is second with about 36 percent of the total production but utilizes almost one-half of the world cassava area.

Being the major cassava producer in the world, Brazil produces about one-third of the total world production and about 85 percent of the South American production (Table 1). Second in importance is Indonesia with about 15 percent of total world production.

The highest average yields by continent are found in South America with about 14 tons/ha. (Table 33), followed by Oceania, 11 tons/ha. Estimated yields for Africa are less than half of those for South America. Among countries, the highest yields are found in Malawi, 23 tons/ha., followed by Brazil, 20 tons/ha. (Table 2). Average world yields are esti-

mated to be 8.69 tons/ha.

Production per capita was estimated at about 200 kilograms for South America and 144 kilograms for Africa (Table 39). Average production per capita for the countries included in the analysis was estimated at 69 kilograms. Three countries showed an annual per capita production above 600 kilograms: Central African Republic, Paraguay and Togo (Table 3). The tendencies of production per capita by country are shown in Figures 1 to 82.

As shown by the figures, most countries show a decreasing trend indicating that population expansions exceeded increases in cassava production.

PROLOGO

El Centro Internacional de Agricultura Tropical (CIAT) es un centro internacional de investigación y adiestramiento, dirigido para acelerar el desarrollo agrícola y económico en las tierras bajas del trópico.

La investigación dirigida al incremento de la producción y la productividad de yuca es una de las principales actividades llevadas a cabo por el Centro.

El presente informe hace disponible una compilación de datos secundarios sobre área, producción y rendimientos de yuca y analiza recientes tendencias históricas en la producción de yuca per cápita en 82 países.

Siendo este el primero de una serie de estudios los cuales van a ser llevados a cabo sobre yuca por el Programa de Economía Agrícola, esta dirigido para proveer a los investigadores de yuca fácil acceso sobre la información estadística básica.

Estudios sobre sistemas de producción de yuca, fluctuaciones de los precios y demanda potencial futura para yuca están en adelanto y serán publicados una vez terminados.

Sus comentarios y sugerencias con relación a este informe y futuras investigaciones serían muy apreciados.

Per Pinstrup-Andersen
Lider, Programa de
Economía Agrícola

AGRADECIMIENTO

La elaboración de este estudio fue orientada por Gerald I. Trant y Per Pinstруп-Andersen.

Los diagramas fueron elaborados por María Eugenia Alvarez y Armando Martínez.

Numerosas personas colaboraron en este estudio. A todas ellas muchas gracias.

INTRODUCCION

A pesar de que la yuca es una fuente importante de carbohidratos para la población de un gran número de países tropicales, la investigación dirigida al incremento de la producción y productividad de este cultivo ha sido relativamente escasa.

El objetivo de este informe fué recopilar cierta información básica sobre producción de yuca y analizar las tendencias pasadas de la relación entre producción de yuca y población para cada uno de los países productores de yuca.

FUENTE DE INFORMACION

La información básica fué obtenida de los boletines estadísticos publicados por la Organización de las Naciones Unidas para la Agricultura y la Alimentación (FAO) y el Acuerdo General sobre Aranceles y Comercio (GATT).

Definiciones

Los siguientes símbolos son empleados en las tablas:

- Nada o cantidad insignificante (menos de la mitad de la unidad indicada), o partida no aplicable.

... No se dispone de datos.

Los decimales se separan de los enteros por un punto (.).

Para un número de países africanos, el término "Farms and Estates"

se refiere a empresas manejadas principalmente sobre una base comercial y adecuadamente explotadas por una agricultura desarrollada. "Villages" se refiere a pequeñas granjas que están utilizando métodos de producción tradicionales.

METODOLOGIA

La tendencia en la producción per cápita de yuca fué estimada por una regresión lineal simple, utilizando la ecuación $y = a + bx$, donde "y" es producción per cápita en kilogramos y "x" es el código para años. El coeficiente "a" expresa la producción estimada per cápita en kilogramos en el año previo al primer año para el cual la información fué disponible. El coeficiente "b" indica el cambio en la producción de yuca en kilogramos per cápita durante el periodo considerado.

Algunos de los países analizados muestran una tendencia definida en alguna parte durante el periodo para el cual se disponía de datos, pero no para el periodo completo. Se hizo un análisis de regresión adicional incluyendo solamente los años en los cuales se presentaba una tendencia aparente en esos países. La línea de regresión que se refiere al periodo total está indicada por una línea continua mientras que la línea de regresión parcial con una línea punteada. Como está expresado por medio del coeficiente de correlación (R^2), algunos de los países presentan una fluctuación grande en la producción anual sin ninguna tendencia aparente.

CONCLUSIONES

El área sembrada con yuca muestra un incremento de 200.000 hectáreas por año durante el periodo considerado (Tabla 45). Los mayores incrementos son encontrados en Africa y Sur América con incrementos anuales de 480.000 y 124.000 hectáreas respectivamente.

De la misma forma, la producción mundial de yuca presenta una tendencia ascendente. Durante el periodo considerado, la producción mundial se incrementó en dos millones de toneladas métricas anuales, aproximadamente, siendo Africa y Sur América los principales contribuyentes. El rendimiento mundial de yuca no presentó cambios durante el periodo (Tabla 46). El Africa presenta un descenso en la tendencia en rendimiento de cerca de 110 kilogramos por hectárea anualmente, mientras que en Sur América se presenta un incremento en la tendencia de 90 kilogramos hectárea. La producción per cápita se incrementó en 7.5 kilogramos anuales en Sur América pero decreció para el resto de continentes considerados. La producción per cápita parece haber sido constante durante el periodo 1963-1968.

Cerca del 40 por ciento de la producción mundial de yuca proviene de Sur América (Tabla 27) y es producida sobre un 25 por ciento del área mundial sembrada. Africa es el segundo con un 36 por ciento de la producción total pero utiliza casi la mitad del área mundial sembrada con yuca.

Siendo el principal productor de yuca en el mundo, Brasil produce cerca de un tercio de la producción total del mundo y cerca del 85 por

ciento de la producción en Sur América (Tabla 1). El segundo en importancia es Indonesia con un 15 por ciento de la producción mundial.

Los más altos rendimientos promedios se encuentran en Sur América con cerca de 14 toneladas por hectárea (Tabla 33), seguido por Oceanía, 11 toneladas por hectárea. Los rendimientos estimados para África son menos de la mitad de los de Sur América. Entre países, los más altos rendimientos se encontraron en Malawi, 23 toneladas por hectárea, seguido por Brasil, 20 toneladas por hectárea (Tabla 2). Los rendimientos promedios mundiales están estimados en 8.69 toneladas por hectárea.

La producción per cápita fué estimada alrededor de 200 kilogramos para África (Tabla 39). La producción per cápita promedio para los países incluidos en el análisis fués estimada en 69 kilogramos. Tres países mostraron una producción anual per cápita por encima de 600 kilogramos: República Centro Africana, Paraguay y Togo (Tabla 3). Las tendencias en la producción per cápita por países se presentan en las Figuras 1 a 82.

Como se presenta en las figuras, la mayoría de los países muestran una tendencia descendente indicando que el crecimiento de la población excede al incremento en la producción de yuca.
